

Among You :D

INTRODUCTION:

You are an astronaut who wakes up on Planet 999 where an alien species lives, and you don't fully remember how you got there. You're inside a spaceship built by this alien species called the BLAH. Everything in the spaceship works but everything is operated by the BLAH language. To survive, you need to navigate the spaceship by each room, and ultimately communicate to the BLAH species that you want to go back to earth. You cannot leave the spaceship as the planet is inhabitable for humans. Obviously, since the BLAH species are extremely intelligent and benevolent, as soon as you communicate your desire, they will immediately give you a spaceship so that you can travel back to Earth - you just have to tell them what you need :)

The BLAH language directly mirrors the English language (i.e. English morphological rules), and uses the same letters. By the end, when the game reveals the mapping, you realize you've been learning how English words are built all along.

Storyline arc: Wake up confused → learn basic words to open the first door → pick up prefixes and suffixes to get past security → combine everything to operate complex machinery → build a full sentence ("I return to Earth") to activate the portal and go home.

Theme: Stranded astronaut / alien planet survival (combines Stacy's spaceship/escape-room idea with Alex's language-decoding mechanic (Project Hail Mary meets linguistics)).

Target Audience: 6th grade (for the lesson), more flexible for the game itself

Every Stage = GOAL → OBSTACLE → LANGUAGE AS TOOL → SUCCESS

Stage	Game Goal	Obstacle	Language Skill Needed
1	Figure out where you are and get out of the room	Everything is labeled in BLAH; door to clinic is locked	Root words, -nu suffix, pronouns
2	Find and take the correct antiviral medicine for yourself	Medicine bottles are labeled in BLAH with prefixes you don't know yet	Prefixes (un-, pre-, post-, anti-, re-)

Stage	Game Goal	Obstacle	Language Skill Needed
3	Figure out what happened and manufacture antivirus in bulk to bring home	Lab logs are in BLAH past tense; machine requires BLAH commands	Past tense (-uk), verb roots, sequencing
4/5	Communicate with the aliens and go home	Must speak in BLAH to be understood	Full sentences, combining all morphemes

BLAH Language Map: (for our use)

Roots:

BLAH Root	English Root	Visual Cue
rom	Planet	
il	I / me	
al	You (singular)	
el	They / them (singular)	
ol	It	
ill	We/us	
all	You (plural)	
ell	They / them (plural)	
kume	say/speak	
	move/go	
ramde	fly/pilot	Crewmate directory
derbe	cure/heal	Crewmate directory
	see/look	

gane	Lock	
moll	fill	
sondy	Surgery	
junke	fail	

Prefixes:

BLAH Prefix	English Prefix	Visual Cue
doda	aqua/hydro	
op-	un-	A door that displays the word “locked” until the player interacts with it to “unlock”
a-	pre-	2 side-by-side images the player finds displayed of himself before (pre-) and after (post-) a minor medical operation that a medic on the spaceship did
me-	post-	2 side-by-side images the player finds displayed of himself before (pre-) and after (post-) a minor medical operation that a medic on the spaceship did
pua-	anti-	The labels on a medicine bottles (anti-[insert virus/disease])
ya-	re-	Tray with empty medicine bottles and a “re-fill” machine.

Suffixes:

BLAH Suffix	English Suffix	Visual Cue
-plum	-able	
-nu	-er (person who does ____)	Crewmate directory
-ed	-uk	
-mar	-ery (place where ____)	

Full Word Generation Table:

BLAH Word	Structure	English Equivalent	Meaning
kume	Root	speak/say	
opkume	op+kume	unspeak	To not speak or to be silent
akume	a+kume	prespeak	predict
kumeplum	kume+plum	speakable	Able to be spoken
akumeplum	a+kume+plum	prespeakable	predictable
opakumeplum	op+a+kume+plum	unprespeakable	unpredictable
opgane	op+gane	unlock	unlock
ramdenu	ramde+nu	fly-er	pilot
derbenu	derbe+nu	cure-er	doctor

Sentence Structure:

SCENE DESIGN:

TWO BARS: The Core HUD

The player always sees two bars at the top of the screen:

Health Bar (left side)

- Starts at ~60% (the player is sick with the zado virus but the aliens have been treating them)
- Slowly ticks down over time (very slowly, not stressful, just present)
- Goes UP when the player takes medicine (Stage 2 goal)
- Visual: red/green gradient bar with a heart icon
- Purpose: gives the player a personal, immediate reason to find medicine. Not just "bring medicine home for Earth" but "I need medicine RIGHT NOW too"
- If it gets low, the screen edges get a slight red tint as a warning
- The health bar is NOT a fail state. It never hits zero. It just creates gentle urgency

Vocabulary Bar (right side)

- Starts empty (0 words)
- Fills up as the player collects new words
- Shows a count: "Words: 7/22" (or whatever the total is)
- **Clickable dropdown** that shows all collected words in a simple list
- Each word shows: BLAH word, English meaning, and a small icon for the category (root, prefix, suffix)
- New entries flash briefly when added
- Purpose: the player's word inventory. When they hit a puzzle, they can open the dropdown to review what they know
- Simple list. No fancy decomposition, no auto-detection logic. Just a running inventory of BLAH = English pairs grouped by type.

Words: 14/22 [v]
ROOTS
rom = planet doda = water ema = mom eba = dad gane = lock moll = fill

PREFIXES
op- = un- a- = pre- pua- = anti- ya- = re-
SUFFIXES
-uk = -ed (past) -nu = -er (person)
PRONOUNS
il = I/me al = you

HOW THE PLAYER ACTUALLY BUILDS VOCABULARY

Pattern	What the Player Does	When to Use	Implementation
A: Click and Label	Click object, see popup with 4 options, pick the right meaning	Individual words from visual context	Popup component with 4 buttons. One is correct. Wrong = flash orange. Right = chime + add to bar.
B: Match Pairs	Drag/draw lines between BLAH words and English meanings	Multiple words in one scene (drawing, treatment wall)	Drag-and-drop or click-to-pair interface. 3-5 pairs. Each correct match adds to bar.
C: Build and Test	Drag vocab tiles into slots to construct a word, then test it	Door locks, machines, the dodarom moment	Slot interface. Available tiles come from vocab bar. Correct combo triggers a result (door opens, machine runs).

Pattern A: "Click and Label" (easiest to implement)

Player clicks a glowing object. A popup appears showing the BLAH word and 3-4 English options. Player picks the right one. Word gets added to the vocabulary bar.

Example: Player clicks the liquid dispenser. Presses the "doda" button. Clear water comes out. A popup appears:

What does "doda" mean?

[fire] [water] [food] [air]

Player picks "water." Chime plays. "doda = water" is added to the vocabulary bar.

Why this works: It forces the player to actively think about the meaning rather than passively reading it. The visual context (water coming out) makes the right answer obvious, so it is not frustrating. But the act of choosing makes it stick.

When to use: For individual root words learned from visual context (posters, drawings, machines).

Pattern B: "Match Pairs" (for learning multiple words at once)

Player clicks an object that has multiple BLAH labels. A matching puzzle appears: drag BLAH words on the left to English meanings on the right.

Example: Player clicks the child's drawing. Three figures with labels appear. A matching interface:

Match the words:

[ema] ----- [I/me]

[eba] ----- [mom]

[il] ----- [dad]

Player draws lines or drags to match. Visual cues (doctor outfit, pilot uniform, child pointing at self) guide the answers. Each correct match adds to the vocabulary bar.

When to use: For scenes with multiple labeled items (the drawing, the treatment wall, the medicine shelf).

Pattern C: "Build and Test" (for combining morphemes)

Player reaches a puzzle that requires building a word from parts. The puzzle interface shows slots. The player drags tiles from their vocabulary bar dropdown into the slots. If the combination works, the new combined word is added to the bar.

Example: Player reaches the locked door. The door shows:

[____] + [gane] = ???

Available tiles (from your vocabulary):

[rom] [doda] [ema] [eba] [il] [op-]

Player drags "op-" into the blank. The word "opgane" forms. The door label changes from "locked" to "unlocked." The door opens. "opgane = unlock" is added to the vocabulary bar.

When to use: For door locks, machine interfaces, and any moment where the player combines known parts into new words.

GUIDANCE (without hand-holding)

Glow on Clickable Objects

Objects the player can interact with have a subtle blue outline glow.

Progressive Thought Bubbles

If the player does nothing for 20+ seconds, a thought bubble appears with a gentle nudge.

These get more specific over time:

- 20 sec: "I should look around this room more carefully..."
- 35 sec: "That [object] on the wall looks interesting..."
- 50 sec: "Maybe I should click on the [specific object]..."

Puzzle Feedback

- Wrong answer: element flashes orange briefly, then resets. No penalty. Try again.
- Right answer: chime, green flash, word added to bar.
- The game never tells you the answer. It just lets you keep trying.

Word Reuse Across Rooms

The most natural way to signal "this word matters" is to show it again in a new context. The word "gane" appears on the door in Stage 1, then on the containment chamber in Stage 3, then in the log entries. By the third time, the player knows what it means without anyone telling them it is important.

STAGE 1: (Room 1 - pilot's cabin) - "FIGURE OUT WHERE YOU ARE"

I'm thinking that this stage is super scaffolded, like a tutorial; maybe it's more sequential than free-play (you click on things in order rather than clicking on everything in any order)

GAME GOAL: Explore the cabin, collect vocabulary, and unlock the door.

Win condition: Build "opgane" at the door lock using Pattern C.

HUD at start: Health bar at ~60%. Vocabulary bar at 0/22.

Duration: ~3-4 minutes

What	How	Why	Knowledge Gained
INTRO CINEMATIC: Player begins the game by waking up as an astronaut in the pilot's cabin. They learn that they have amnesia. Blinking eyes. Metal walls. Card in pocket (English): "We are all counting on you to bring home the antiviral medicine to cure zadotitis." Flashbacks: goodbye, crash, alien hands.	The game begins with the astronaut blinking (?), and asking themselves questions (in English) such as "Where am I?", "How did I get here?".	This sets the scene for the rest of the game: the player has a mystery to solve. The astronaut speaks English natively.	

HUD appears. Health bar at 60%, vocabulary bar at 0. A brief tooltip explains: "Health: you are infected with the virus that causes <u>zadotitis</u>. Find medicine. Words: click objects to learn the alien language."	Player dismisses tooltip.	Tutorial tooltip, only explicit instruction in the game.	None, yet except that the player is sick
Chatroom message. Player learns that the crew of the spaceship speaks an alien language. Big screen blinks with a notification. Player clicks it. A message in BLAH they cannot read. Below the message: an alien avatar icon with a waving hand and the label "al." A thought bubble: "They are talking to me... 'al' must mean 'you.'"	Player clicks on various objects (computer screen, sticky notes, journal). They can't interact with these objects yet but they can observe them in any order they please. Player clicks screen. Pattern A popup: "The alien is waving at you. What might 'al' mean?" Options: [I/me] [you] [hello] [help]. Player picks "you."	This sets the plot for the game; in order to figure out how they got here and what has happened, they need to figure out how this language works.	Need to learn unknown language; al = you
Window + planet posters. Player clicks window (dark sky, stars, red planet). Two posters show different planets labeled "fannarrom" and "desarrom." The shared ending "rom"	Player clicks each poster. After clicking both, Pattern A popup: "The names of these celestial objects end in 'rom.' What does 'rom' mean?" Options:	Pattern A: click and label. The color-coding of "rom" in both words draws the eye to the pattern. Clicking both posters is required before the popup triggers.	rom = planet

is in a different color on both posters.	[star] [planet] [big] [red].		
Crew Roster Player notices another poster. This poster has photos of the alien crewmates. The different crewmates are uniformed according to their role on the ship. Two photos are labeled “ramdenu” and “derbenu” respectively.	Player clicks on the poster. Pattern A popup: “The titles of the alien crewmates end in ‘nu’. What does ‘nu’ mean?” Options: [person] [place] [thing] [theory] Once the player answers correctly, another popup occurs. Pattern A popup: Contains picture of the pilot and its label. “Indeed, ‘nu’ means person. What could ‘ramde’ mean?” Options: [dance] [cure] [fly] [teach] Once the player answers correctly, another popup occurs. Pattern A popup: Contains picture of the medic and its label. “What could ‘derbe’ mean?” Options: [dance] [cure] [fly] [teach]		nu = person ramde = fly derbe = cure
Liquid dispenser. Machine with 3 buttons: "tito," "bibì,"	Player presses each button. After pressing "doda" and	Pattern A: click and label. The water	doda = water

"doda." Each makes a different liquid. "Doda" makes clear water.	seeing water: Pattern A popup: "This button made water. What does 'doda' mean?" Options: [juice] [water] [milk] [soda].	visual is unmistakable.	
Bed label. A tag on the bed reads "al: rom?" and "puacarda x 2/3."	Player clicks the label. With "al" and "rom" already in vocabulary, those words highlight in green in the label. The player can now read: "you: planet?" (the aliens were asking where you are from). "puacarda" stays white/unknown. A thought bubble: "They wanted to know what planet I am from. And they have been giving me something called 'puacarda'..."	No popup here, just reading comprehension using known words. "puacarda" is added to the vocab bar as "puacarda = ???" (unknown, flagged for later).	puacarda = ???
Locked door -- STAGE PUZZLE. Door displays "ganeuk." A dial/key mechanism next to it. When the player clicks the door, a thought bubble: "This door is sealed. The word on it ends in 'uk' but I do not know what that means yet.	Player clicks the door. First, Pattern A popup for "gane": "This door has a lock symbol. What might 'gane' mean?" Options: [door] [lock] [open] [wall]. Player picks "lock." Then the Pattern C word-builder appears: a slot	Pattern A (for "gane") into Pattern C (building "opgane"). The prefix options (op-, a-, ya-, me-) are given on the door mechanism itself, not from the vocab bar, since the player has not learned prefixes yet. This is the one place where the	gane = lock, op- = un-, opgane = unlock

Maybe I can figure out this lock mechanism."	before "gane" with available tiles from the vocabulary bar. Player drags "op-" (which is offered as one of several prefix options: op-, a-, ya-, me-). Only "op-" works. When placed: "opgane" = the lock symbol animates from locked to unlocked. Door opens!	game introduces new morphemes directly. The player learns "op- = un-" through seeing the result.	
Stage complete. Door opens. Brief transition: "Stage 1 complete! Words found: 11." Health bar is now at ~55% (ticked down slightly during play, adding gentle urgency for Stage 2).	Automatic.	Vocab bar shows progress. Health bar drop motivates finding medicine in Stage 2.	

Stage 1 Vocabulary Bar State:

Roots: rom (planet), doda (water), gane (lock), ramde(fly), derbe(cure) **Prefixes:** op- (un-) **Suffixes:** -nu (person) ("-uk" was seen but not understood) **Pronouns:** al (you) **Full words:** opgane (unlock), ramdenu (pilot), derbenu (doctor) **Unknown:** puacarda (???)

STAGE 2: (Room 2: clinic/medical room on the spaceship): "GET YOUR MEDICINE"

GAME GOAL: Find and take the correct antiviral medicine for yourself.

Win condition: Select the correct bottle (puacarda) from the medicine shelf.

HUD update: Health bar is at ~55% and still ticking. Finding the medicine is personal now.

Duration: ~3-4 minutes

What	How	Why	Knowledge Gained
Enter the clinic. Player notices a sign on the wall that says “derbemar”. Player thinks “this must be the name of this place.”	Player clicks on the sign. Pattern A Popup: “We know ‘derbe’. What does ‘mar’ mean?” Options: [person] [place] [thing] [theory]	Recognition of “derbe” from Stage 1. Players learn that suffixes can modify roots to yield noun type (person, place, etc). Player learns that they have entered a place of curing aka clinic.	-mar=-ery
Computer Screen. A notification sound is made and a computer screen lights up. An alien medic NPC (wearing the same outfit as “derbenu” in the crewmate directory) appears on the chat screen with the label “derbenu”.	Player clicks on the computer screen. The medic speaks to the player with words and gestures: “il derbeuk al”. When they say “il”, they point to self. When they say “al”, they point to player. Pattern A Popup: “We know ‘al’. What does ‘il’ mean?” [you] [they/them] [she/her] [I/me] Another popup. Pattern A Popup: “We know ‘derbe’.	Teaching past conjugation and the I/me pronoun.	il = I/me -uk = -ed

	We saw 'uk' on the door lock. What does 'uk' mean?" Options: [-ed/already happened] [-ing/happening now] [-ly/describes how] [-s/more than one]. The medic speaks to the player again with words and gestures: "al derbe al". Player thinks, "I must treat myself".		
Treatment wall. Player explores the clinic which has a number of stations. The first is a collection of side-by-side images of before and after images of treatments the doctor has given. Each pair labeled with BLAH text. The left photo always starts with "a-" and the right always starts with "me-." One pair shows the PLAYER with labels "a-sondy" and "me-sondy."	Player can click on a wall to zoom in and see the collection of pictures with their "pre-treatment", "post-treatment" labels. Player clicks the wall. Pattern B: matching puzzle. Two pairs to match: "The LEFT photos all start with 'a-'. The RIGHT photos all start with 'me-'. Options: [a- = before, me- = after] or [a- = good, me- = bad] or [a- = big, me- = small]. Player picks before/after. Then a second popup. Pattern A Popup: "The photos	By looking at these images, including one of him/herself, the player can infer that pre- and post- are prefixes that refer to before and after. Pattern B with visual context. The before/after layout makes the prefix meaning obvious. The medical setting makes "sondy = treatment" guessable.	a- = pre- (before), me- = post- (after), sondy = surgery/treatment?

	show 'sondy.' Based on the medical setting, what is 'sondy'?" Options: [surgery/treatment] [exercise] [meal] [sleep].		
Medicine shelf -- STAGE PUZZLE. 5 bottles with BLAH labels: (a) puacarda (b) pualomi (c) puafleck (d) derbeplum (e) yamollcarda. The player needs to pick the right one. The player moves to the next station, which is a counter with medicine bottles. He notices half are full and half are near a machine waiting to "refilled"	When the player clicks to interact with a filled medicine bottle, he can see its label "anti-virus" with a crossed out image of a viral creature. When the player goes to the empty bottles, he notices a button on a machine labelled "refill" that refills bottles when he clicks on it. Player clicks each bottle to inspect it. Each bottle's label appears large on screen. The player can open their vocab bar for reference. Thought bubble after looking at 2+ bottles: "Three of these start with 'pua-.' And I saw 'puacarda' on my bed label. The aliens were giving it to me..." Pattern A popup after inspecting the "pua-" bottles: "Three bottles start with 'pua-.' Based on the	These two interactions expose the player to new prefixes Pattern A (for pua-prefix) into a selection puzzle (pick the right bottle). The bed label callback ("puacarda = ???" in the vocab bar from Stage 1) is the key clue..	pua- = anti-, puacarda = antivirus (resolved from ???)

	image on the labels, what does 'pua-' mean?" Options: [anti-/against] [super-/extra] [new-/fresh] [old-/expired]. Then the player must SELECT the right bottle. They know "puacarda" from their bed label. Click it. Medic nods. Health bar jumps to 80%!		
Refill machine. Empty bottles near a machine. Display shows "moll: 0." Button labeled "yamoll." Player presses it: bottles fill, display changes to "moll: 6."	Player clicks the button. Bottles fill up visually. Pattern A popup: "yamoll' made the bottles fill again. 'moll' probably means 'fill.' What does 'ya-' mean?" Options: [un-/not] [re-/again] [pre-/before] [anti-/against]. Player picks "re-/again."	Pattern A: click and label. The cause-and-effect (press button, bottles refill) makes the meaning clear. The player already knows the other prefixes, so process of elimination helps too.	ya- = re-, moll = fill, yamoll = refill
The "-plum" bottle. While exploring, the player may have noticed "derbeplum" on one of the wrong bottles. If they click it after learning "derbe" = heal (from Stage 1): thought bubble: "Derbe means heal. And '-plum' is on the	Optional interaction. If clicked: "-plum = ???" is added to the vocab bar as unknown.	Passive seed-planting. No popup, just a thought bubble. This pays off in Stage 4.	-plum = ??? (unknown)

end. I do not know what '-plum' means yet, but I will keep it in mind."			
Stage complete. Player gets medicine. Health bar jumps to 80%. A new door opens to the lab. Thought bubble: "I feel better. But the card said to bring medicine HOME. I need more than one dose. A lot more."	Automatic transition	Health bar payoff is satisfying. The "need more" thought sets up Stage 3.	

Stage 2 Vocabulary Bar State:

Roots: rom, doda, ema, eba, gane, moll (fill), sondy (surgery) **Prefixes:** op- (un-), a- (pre-), me- (post-), pua- (anti-), ya- (re-) **Suffixes:** -uk (-ed), -plum (??? seen but unknown) **Pronouns:** il, al
Full words: ramdenu, derbenu, opgane, puacarda (antivirus!), yamoll (refill)

STAGE 3: (Room 3 - lab player pieces together what happened)

STAGE 3 REVISED : MAKE THE MEDICINE AND PREPARE TO SPEAK.

GAME GOAL: Figure out what went wrong in the lab AND manufacture bulk antivirus to send to Earth.

Win condition: Operate the manufacturing machine AND successfully construct a basic BLAH sentence to unlock the communication chamber.

HUD update: Health bar stable at 80%. Vocabulary bar growing. First time player uses vocab bar actively to *construct commands + sentences*

Duration: ~4-5 minutes

What	How	Why	Knowledge Gained
Enter the Lab. Player notices a sign on the wall that says “crutamar”. Player thinks “this must be the name of this place.”	Player clicks on the sign. Pattern A Popup: “We know ‘mar’. What does ‘cruta’ mean?” Options: [fly] [paint] [cook] [science]		
The player enters a Damaged lab (context). Broken containment chamber and warning lights.	Player clicks environment. Short thought bubble: “Something escaped...”	Keeps story continuity without adding new grammar.	Context only
Manufacturing machine activates. Screen: “BLAH COMMAND REQUIRED.”	Player opens interface with slots: [___] + [___]. Uses vocab tiles. options: Puacarda Moll Doda Gane	The player must build a command using what they already learned. Language becomes a tool to act, not just decode.	Commands = verb + object
Operate machine (make medicine).	Player builds: moll + puacarda → fill. Then yamoll +	Applies known words in a functional system.	moll = fill; ya- = re- (already knows)

Empty chamber + bottles.	puacarda → refill in bulk. Once the correct inputs are made, the machine responds, it fills with medicine, turns lights on		
Destination puzzle. Star map shows blue water planet.	Player builds: doda + rom → dodarom. Machine locks destination.	Reinforces word construction tied to story goal.	dodarom = Earth (already knows)
Communication trigger. Alien appears (in a chatbot?): “al kume?”	Player infers meaning of kume via Pattern A popup.	Introduces communication as next step.	kume = speak (already knows)
Final puzzle (first sentence). Door locked: “RESPOND IN BLAH.”	Player builds: il kume (al) → door opens.	First full sentence → prepares next stage.	il = I; sentence structure: pronoun + verb (+ object)
." Thought bubble: "They are talking about me and Earth. I need to talk to them. I need to tell them I want to go home."			

Stage 3 Vocabulary Bar State:

Roots: rom, doda, ema, eba, gane, moll, sondy, junke (fail), fero (escape), ramde (fly, decomposed from ramdenu), derbe (heal, decomposed from derbenu) **Prefixes:** op-, a-, me-, pua-, ya- **Suffixes:** -uk (-ed), -nu (-er person), -plum (??? still unknown) **Pronouns:** il, al
Constructed words: dodarom (EARTH!), opgane, puacarda, yamoll

Stage 4: Go home!

Setting: Ship bridge (command center) - same as pilot's cabin?

GAME GOAL: Prove to the friendly alien commander that you are cured, and negotiate your departure to Earth.

Win condition: Successfully hold a conversation with the captain of the spaceship

HUD update: Health bar stable at 80%. Vocabulary bar growing.

Duration: ~3-5 minutes

What	How	Why	Knowledge Gained
Player enters the bridge, where the commander now is! They are not hostile, but instantly put on a mask and motion you to back off.	The main console locks ("ganeuk"). The screen displays a question from the commander: "al... opderbe?" (You... uncured? (sick)). Conversation Puzzle 1: The Pattern C interface opens. The player must reassure the commander. Correct answer: [il] + [derbe] + [-uk] (I healed).	The player must prove they took the medicine from Stage 2 before the aliens will allow you to leave.	

Medic quickly bioscans you and verifies that you are cured.	The commander says: "dodarom junke? Dodarom opderbe?" (Earth failing? Earth sick?) Conversation Puzzle 2: You must state your destination and purpose Correct answer: [il] + [ya-] + [ramde] + & + [derbe] + [dodarom] (I fly again & heal Earth)		
The commander points to the full cargo hold of a ship and wait for your request.	The commander says: "rom?" (Planet?) Conversation Puzzle 3: You must ask the commander to ship the medicine to the Earth Correct answer: [al] + [ramde] + [puacarda] + dodarom (you fly medicine to the Earth)		
After instructing other aliens to help load, you get into the small ship and prepare to take off. The commander salutes you. You take off for home.	Commander: "ya-derbe dodarom." (reheal Earth)		

STAGE 5: “Speak to Go Home” (same as room 4)

Alien pops up, player must have a conversation with them to tell them they need to go home.

Final Conversation:

Alien: Who are you?

You: I pilot.

Alien: You speak! What happened?

You: Virus escaped. Mom, dad gone. Need return (re-go) Earth.

Alien: Earth locked. Help me unlock.

You: *solves some arbitrary final puzzle*

portal opens for you to go home

List of morphemes that should have been learned by now:
